Comments for the first version:

The assignment looks good - I would make sure that I meet all the code quality checklist, that fault tolerance is implemented (what happens if the client cannot connect to the aggregation server?)

I would also print out what each test is testing - and make sure that I have an extensive test suite in place.

Changes:

- Add comments on methods
- Clients retry after a connection failure
- Print the information of each test case
- Add test case on the fault tolerance of client-side
- Add test cases on the response code of 200/201/204/400/500
